

All LAFLA Closed Cases - Actual vs Predicted 2002

Standard Deviations Above or Below Predicted by Census Tract

Note 1: Inset maps are not to scale.

Note 2: This map shows the difference between the actual number of cases closed in a Census Tract vs the predicted number of cases based on the Census Tract poverty population at the 125% poverty level. The map shows the standardized residuals in units of standard deviation above and below the predicted value. Positive standardized residuals indicate more observed cases than predicted by poverty based on a linear regression analysis, while negative standardized residuals indicate fewer cases than predicted.

Source: All Closed Cases - Legal Aid Foundation of Los Angeles (2002); Geocoding Rate: 98%

This map was developed solely for the purpose of determining whether mapping is useful for making management decisions.
